

Five Star Cards - App Summary

What it is

Browser-based two-player card game prototype. Runs as a single Node server that serves the client and powers online play over WebSockets.

Who it's for

Players who want a quick two-player card game in the browser, including solo play versus CPU or online head-to-head.

What it does

- Local offline two-player mode.
- CPU opponent with easy, medium, and hard difficulty options.
- Online multiplayer with host/guest rooms, lobby status, and ready checks.
- Turn-based actions with trading and archiving mechanics (bronze/silver/gems/platinum).
- Core and expanded game formats/rulesets.
- In-game status UI: turn counter, hand/archive counts, and winner overlays.

How it works

- Client: index.html, styles.css, app.js, and src/ui/* render the DOM and wire events; src/game/* holds rules, state, lifecycle, and CPU logic.
- Online client: src/online/client.js manages the WebSocket connection and queues outbound messages.
- Server: server/index.js serves static files via HTTP, runs a ws WebSocket server, keeps in-memory rooms, applies actions via src/game/*, and broadcasts sanitized state back to players.

How to run

- Run npm install.
- Run npm start.
- Open http://localhost:8080 in a browser.
